Session Abstract

Packaging products in the form of boxes, sleeves and panels from plastic hollow twin-wall, triple-layer and corrugated manufacturing processes have widespread applications for reuse. These products are known for their light weight but rigid and durable properties, folding characteristics for maximum shipping density, and customization capabilities to meet unique supply chain specifications. As companies are looking to get more uses out of their packaging, these plastic-corrugated transport packaging products offer performance and economic solutions. This session at the RPA Learning Center convenes experts from suppliers of this product category to share their knowledge and experiences about the expanding market applications and product advantages.

Early Product Uses

Expanding Markets

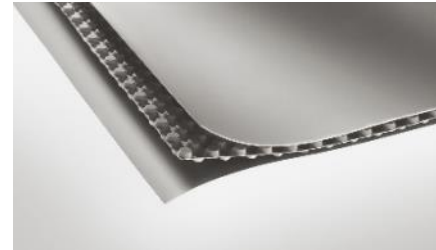

Agriculture

Automotive
